

Amaris Rose

Historic Mine with 17.5% Cu

Tenure: 1111634, 1111653, 1112318, 1113248

Area: 189.58 Ha

The Amaris Rose property consists of four mineral claims (12 cells) totalling 246.68 ha located 6km west of Invermere. Access to the property is by a network of logging roads, just off the provincial highway system. The Swansea Reverted Crown grant (Lot 2576) is located under the Amaris Rose Property.

The history of mineral exploration in the vicinity of Mt Swansea dates to the turn of the century when work was carried out on the Swansea crown-granted mineral claim -L2576, the property was worked in 1898 by the Mines Development and Guarantee Trust Co. of Rosslund who sunk shafts and drove a 140-foot tunnel. Four tons of ore were shipped for mill test. Sampling of ore on the dump by the local Gold Commissioner that year yielded an

assay of 17.5% copper. In 1899 a crew of six men worked all summer on the property, and 100 tons of ore were hauled out the following winter. No reports

of further work are indicated until the crown grant was taken over by Sheep Creek Gold Mines Limited, who did some diamond drilling in 1947 with inconclusive results. In 1956 the crown granted claim and 28 recorded claims surrounding it were held by Mid-West Copper and Uranium Mines Ltd. They drove the new adit for 600 feet of drifting and cross-cutting and 40 feet of raising.

At the Swansea occurrence, tan and white weathering blocky dolomites of the Middle-Upper Cambrian Jubilee Formation are cut by a fault zone trending 020 degrees and dipping about 75 degrees west. The dolomites along this zone are faulted and brecciated with the breccia healed by carbonate containing disseminations and patches of malachite and

azurite with associated bornite, chalcocite and chalcopyrite. A grab sample of malachite-azurite-rich material returned an assay high of 17.5 per cent copper. The fault-breccia zone is variable in width and appears to be located along a single fault zone which hosts both the Swansea and Rose 1 (082JSW007) showings
