

# Babs

## Porphyry Target

Tenure Applications 1128505, 1128526, 1128533, 1128535, 1128543, 1128545

Area 1395.70 Ha

The Babs property consists of six mineral claim applications (75 cells) totalling 1395.70 ha located approximately 74 km east of the community of Smithers, 14km southeast of the former producing Granisle mine and 20km southeast of the former producing Bell mine in west central British Columbia. Access to the property is by a network of logging roads, just off the provincial highway system.

SAMPLE		Gold	5 g/t	Assessment Report 33911.		
2012	N	Assay/analysis Grab				

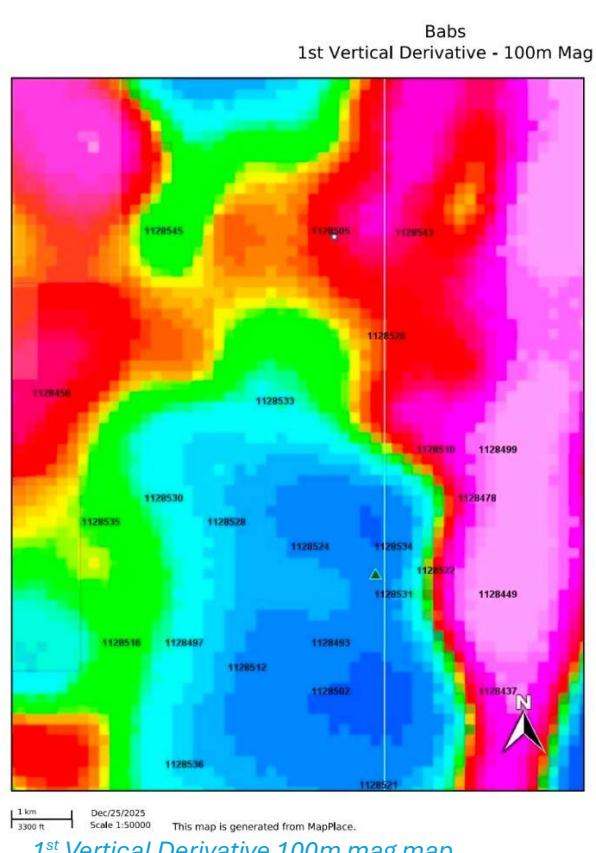

In 1991, prospector Ralph Keefe discovered over 150 sub-angular mineralized Eocene biotite-feldspar-porphyry boulders and cobbles over a 300m x 150m area approximately 2.5km down ice from the Property. The boulders ranged in size from 10cm-1.5m and have assayed up to 1.05% Cu and 1.3g/t Au and contained 1-4% magnetite.

In 2012, several grab samples were identified as medium crystalline biotite feldspar porphyry or a coarse crystalline hornblende-biotite granodiorite. Samples were reported to have contained 1 to 2 per cent pyrite and traces of chalcopyrite. Samples 45224 and 042456 analyzed 5 grams per tonne and 2 grams per tonne gold respectively by ICP-ES analysis but assayed less than 0.005 part per million by Fire Assay Fusion analysis (Assessment Report 33911). Copper values were all less than or equal to 3 parts per million.
